## BRISTA Öko-Wall – the smart alternative to conventional slope stabilization

Slope stabilization without the use of concrete? How is that even possible? With BRISTA, of course. And of course, easy. Because the elements used in galvanized expanded metal adapt to natural landforms easily. With the help of cable ties, they can be arbitrarily attached to each other and thus adapted to the terrain of slopes, embankments and hillsides.

Previous constructions, such as foundations or drains are hereby unnecessary. It saves time and cost and also allows that the vegetation can spread unhindered. Even the root system does not overheat in strong sunlight. And one more advantage: The low weight of the elements made of galvanized expanded metal allows for easy handling.
